Извлечение корня по простому модулю (от Серёжи) $3 \leq p$, $1 \leq a < p$, найти $x^2 = a$

1) Если $a^{(p-1)/2} \neq 1$, return -1
2) Выбрать случайный $1 \leq i < p$
3) $T(x) = (x+i)^{(p-1)/2} \bmod (x^2 - a) = bx + c$
4) Если $b \neq 0$ то вернуть c/b , иначе к шагу 2)

Иногда вместо того чтобы считать первообразный у простого числа, можно написать чекер ответа и перебирать случайный первообразный.

Не заходит FFT по TL-ю – чекнуть что стоит double, а не long double

mt19937 генерит случайный unsigned int, если хочется больше есть mt19937_64

Иногда можно представить ответ в виде многочлена и вместо подсчета самих k-тов посчитать значения и интерполировать

Перед сабмитом чекнуть что все выводится в printf, а не eprintf!!!

Лемма Бернсайда:

Группа G действует на множество X Тогда число классов эквивалентности $= (\sum |f(g)| \text{ for } g \in G) / |G|$ где $f(g) = \text{число } x \text{ (из } X) : g(x) = x$

Число простых быстрее $O(n)$:

$dp(n, k)$ – число чисел от 1 до n в которых все простые $\geq p[k]$
 $dp(n, 1) = n$
 $dp(n, j) = dp(n, j+1) + dp(n / p[j], j)$, т. е. $dp(n, j+1) = dp(n, j) - dp(n / p[j], j)$

Если $p[j], p[k] > \sqrt{n}$ то $dp(n, j) + j == dp(n, k) + k$

Хуяришь все оптимайзы сверху, но не считаешь глубже $dp(n, k)$, $n < K$ Потом фенвиком+сортировкой подсчитываешь за $(K+Q)\log$ все эти запросы Хуяришь во второй раз, но на этот раз берешь прекальканные значения

Если $\sqrt{n} < p[k] < n$ то (число простых до n) $= dp(n, k) + k - 1$
